

The figure displays two histograms side-by-side, comparing the distribution of 'age' for two classes: ADULT_HIV-Pos_NON-SHEDDER (left) and CHILD_HIV-Neg_NON-SHEDDER (right). Both distributions are skewed to the right. The left histogram shows a peak around age 25, while the right histogram shows a peak around age 10. The y-axis represents frequency, and the x-axis represents age.

class: CHILD_HIV-Neg_NON-SHEDDER
